

```
tml::function< tml  
::impl::list_forward  
_iterator< TAIL...> >
```

A diagram illustrating the construction of a function object. A blue arrow points from the static member function `tml::iterator::impl::next` in the bottom box to the `tml::function` object in the top box. The `tml::function` object is a template specialization of `tml::function` that takes the static member function as its argument.

```
tml::iterator::impl  
::next< tml::impl::list  
_forward_iterator< HEAD,  
TAIL...> >
```
